Overview

The Cisco UCS 6454 and 64108 Fabric Interconnects are a core part of the Cisco Unified Computing System, providing both network connectivity and management capabilities for the system. The Cisco UCS 6454 and 64108 offer line-rate, low-latency, lossless 10/25/40/50/100 Gigabit Ethernet, Fibre Channel over Ethernet (FCoE), and Fibre Channel functions.

These Cisco Fabric Interconnects provide the management and communication backbone for the Cisco UCS B-Series Blade Servers, UCS 5108 B-series server chassis, UCS Managed C-Series rack servers, and UCS S-Series storage servers. All servers attached to the Cisco UCS 6454 and 64108 Fabric Interconnects become part of a single, highly available management domain. In addition, by supporting unified fabric, the Cisco Fabric Interconnects provide both the LAN and SAN connectivity for all servers within its domain.

From a networking perspective, the Cisco UCS 6454 and 64108 use a cut-through architecture, supporting deterministic, low-latency, line-rate 10/25/40/50/100 Gigabit Ethernet ports, switching capacity of 3.82 Tbps for the 6454, 7.42 Tbps for the 64108, and 200 Gbps bandwidth between the FI 6454 or 64108 and the IOM or 2408 Fabric Extender per 5108 blade chassis, independent of packet size and enabled services. The product family supports Cisco® low-latency, lossless 10/25/40/50/100 Gigabit Ethernet unified network fabric capabilities, which increase the reliability, efficiency, and scalability of Ethernet networks. The Fabric Interconnect supports multiple traffic classes over a lossless Ethernet fabric from the server through the Fabric Interconnect. Significant TCO savings come from an FCoE optimized server design in which network interface cards (NICs), host bus adapters (HBAs), cables, and switches can be consolidated.

There are two options available under the 6400 Series FI

- [Cisco UCS 6454 54-Port Fabric Interconnect on page 2](#)
- [Cisco UCS 64108 108-Port Fabric Interconnect on page 10](#)

NOTE: From 4.1(3) release, FI 6454 and 64108 supports server-ports on the 40/100G ports after break-out (ports 49-54 and 97-108 respectively). Only direct-connect rack-servers at 10/25G speeds with VIC 1455/1457 are supported on the 40/100G ports. Note that server port at 40/100G speeds are not supported. FI 6454 can support maximum of 64 server-ports and FI 64108 can support 128 server ports after breakout of 40/100G ports.

Notes

1. FI 6454 supports 1G optics on ports 45-48. FI 64108 supports 1G optics on ports 89-96.

2. SFP-10/25G-LR-S & SFP-10/25G-CSR-S works only at 25G speed on FI 6400.
S-Class transceivers (for example 10G and 40G) do not support FCoE.
3. Please note, SFP-H25G-CU4M with VIC1400/FI6400 requires UCSM/CIMC 4.1(2a) with VIC firmware 5.1(2d).
4. Please note, SFP-H25G-CU5M with VIC1400/FI6400 requires UCSM/CIMC 4.1(2a) with VIC firmware 5.1(2d).
Additionally, minimum CIMC Release 4.1(2a) is required to qualify with N9K switches

Supported Configurations

- Select as many transceivers as you have licenses (see *CHOOSE PORT LICENSES (OPTIONAL) on page 22*).
- Fibre channel ports must be physically colocated in to allow them to be selected using the UCS Manager software GUI.

Caveats

- The maximum length of fiber optic runs is limited to 300 meters. This is imposed by our use of 802.3X/802.1Qbb Priority Pauses.

NOTE:

- Transceiver modules and cables that are supported on a specific Fabric Interconnect are not always supported on all VIC adapters, IOMs, or FEXs that are compatible with that Fabric Interconnect. Detailed compatibility matrices for the transceiver modules are available here:
<https://www.cisco.com/c/en/us/support/interfaces-modules/transceiver-modules/products-device-support-tables-list.html>
- S-Class transceivers, (for example QSFP-40G-SR4-S), do not support FCoE.

UCS Drive Retention Service

With the Cisco Unified Computing Drive Retention Service, you can obtain a new disk drive in exchange for a faulty drive without returning the faulty drive.

Sophisticated data recovery techniques have made classified, proprietary, and confidential information vulnerable, even on malfunctioning disk drives. The Drive Retention service enables you to retain your drives and ensures that the sensitive data on those drives is not compromised, which reduces the risk of any potential liabilities. This service also enables you to comply with regulatory, local, and federal requirements.

If your company has a need to control confidential, classified, sensitive, or proprietary data, you might want to consider one of the Drive Retention Services listed in the above tables (where available)

NOTE: Cisco does not offer a certified drive destruction service as part of this service.

Local Language Technical Support for UCS

Where available, and subject to an additional fee, local language support for calls on all assigned severity levels may be available for specific product(s) - see tables above.

For a complete listing of available services for Cisco Unified Computing System, see this URL:

Connectivity

This section explains the connectivity between the Fabric Interconnects (FIs) and Fabric Extenders (FEX). The Fabric Extenders are extensions of the Fabric Interconnects and act as remote line cards to form a distributed modular fabric system. The fabric extension is accomplished through the FEX fabric link, which is the connection between the Fabric Interconnect and the FEX.

A minimum of one connection between the FI and FEX is required to provide server connectivity. Depending on the FEX model, subsequent connections can be up to eight links, which provides added bandwidth to the servers.

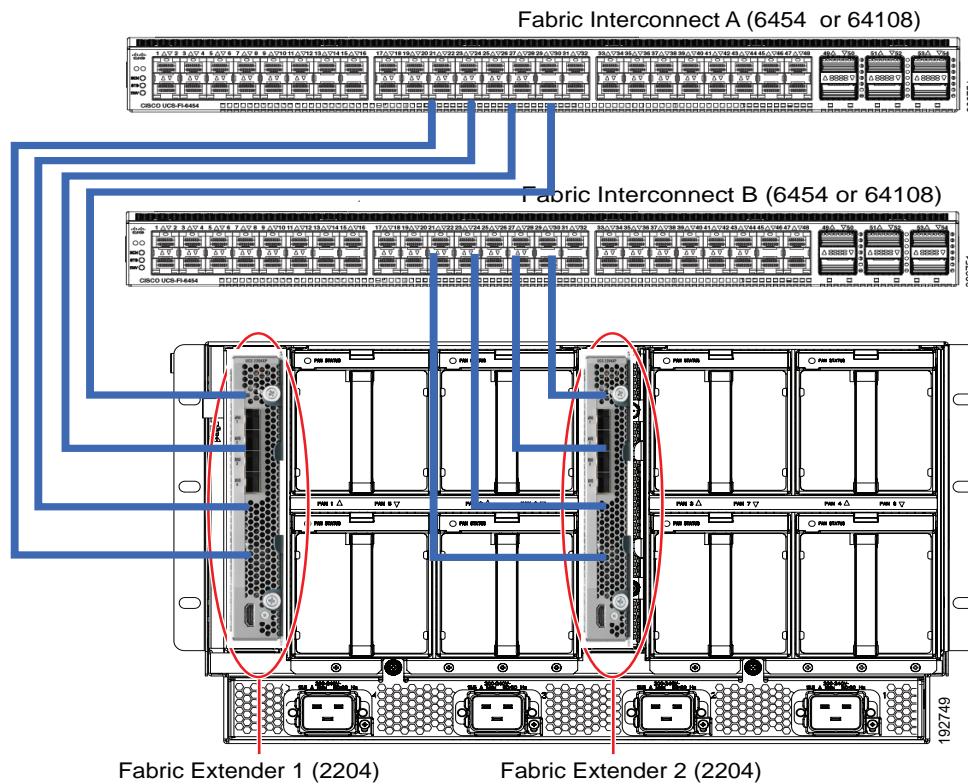

5108 Blade Chassis Server Connectivity

For the 5108 blade chassis, the Fabric Extender modules (up to two) plug into the back of the UCS 5108 series blade server chassis. A midplane connects the blade servers to the Fabric Extenders. The 5108 chassis accommodates the following FEXs:

- Cisco UCS 2208XP
- Cisco UCS 2204XP
- Cisco UCS 2408

Figure 17 shows how the FEX modules in the blade chassis connect to the FIs.

Figure 17 Connecting Blade Chassis Fabric Extenders to Fabric Interconnect Chassis

NOTE: Cisco UCS 5108 rev 1 and rev 2 chassis are both supported with FI 6454 and 64108.

C-Series Rack-Mount Server Connectivity

C-Series servers connect to external FEXs and FIs as summarized in this section. Two interconnection methods are possible:

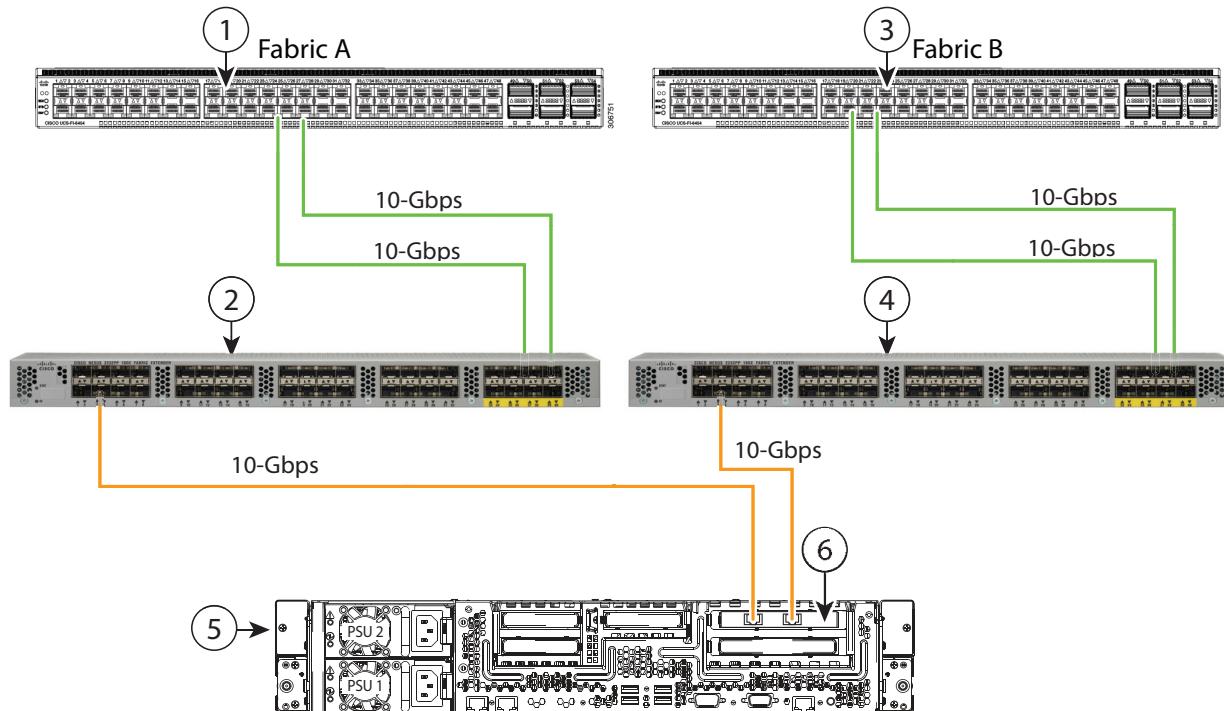

- Single-Wire Management
- Dual-Wire Management

Single-Wire Management

Cisco UCS Manager 3.1 supports an additional option to integrate the C-Series Rack-Mount Server with Cisco UCS Manager using the NCSI. This option enables Cisco UCS Manager to manage the C-Series Rack-Mount Servers using a single-wire for both management traffic and data traffic. When you use the single-wire management mode, one host facing port on the FEX is sufficient to manage one rack-mount server, instead of the two ports you would use in the Shared-LOM mode. This connection method allows you to connect more rack-mount servers with Cisco UCS Manager 3.1 for integrated server management. Make sure you have correct server firmware for integration with Cisco UCS Manager. If not, upgrade your server firmware before integrating the server with Cisco UCS Manager.

Figure 18 shows how the C-Series rack mount chassis connect to the FEXs and FIs for single-wire management.

Figure 18 Connecting C-Series Rack Chassis (single-wire management)

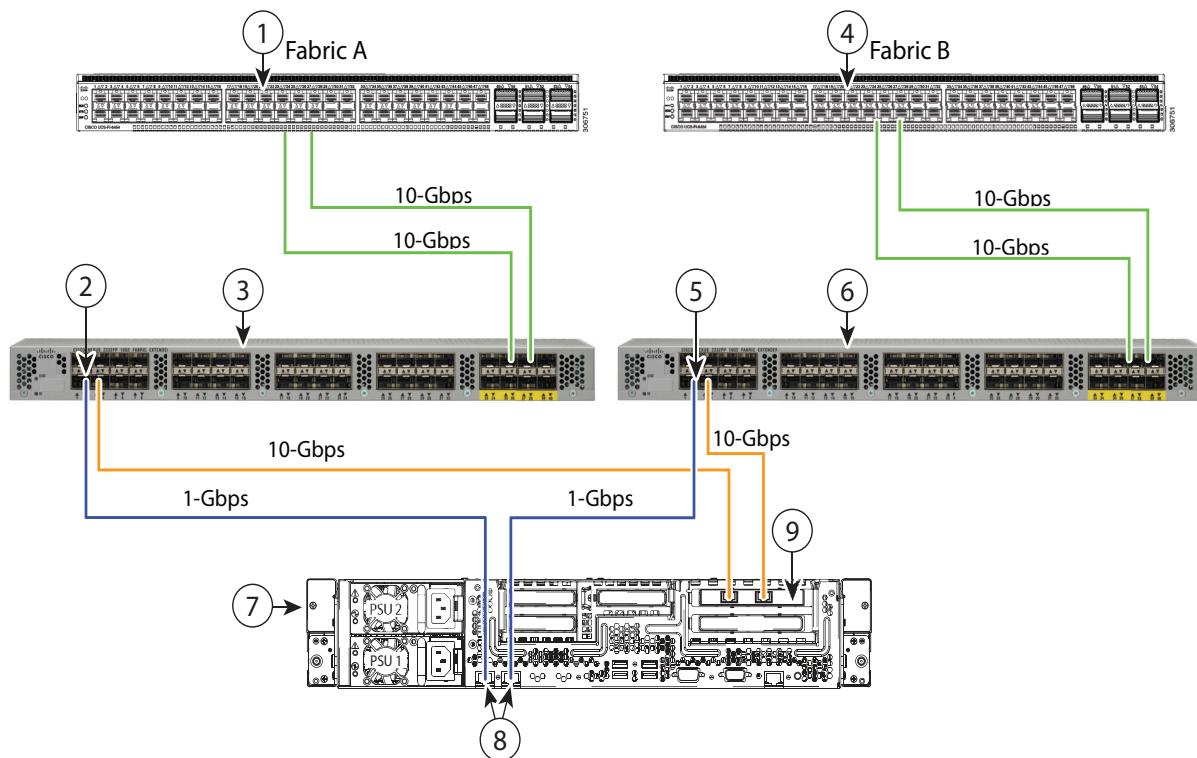

1	Cisco UCS 6454 or 64108 FI (Fabric A)	4	Cisco Nexus 2232PP or 2232TM-E (Fabric B)
2	Cisco Nexus 2232PP or 2232TM-E (Fabric A)	5	Cisco UCS C-series M5 server
3	Cisco UCS 6454 or 64108 FI (Fabric B)	6	Cisco UCS VIC 1445 in PCIe slot 1

Dual-Wire Management

Cisco UCS Manager version 3.1 supports the existing rack server integration and management option through Shared LOM, using two separate cables for data traffic and management traffic. The prerequisites for integration with Cisco UCS Manager are built into the C-Series servers. Make sure you have correct server firmware for integration with Cisco UCS Manager. If not, upgrade your server firmware before integrating the server with Cisco UCS Manager.

Figure 19 shows how the C-Series rack mount chassis connect to the FEXs and FIs for dual-wire management.

2	10GBase-T RJ-45 in Nexus 2232PP (Fabric A)	7	Cisco UCS C-series M5 server
3	Cisco Nexus 2232PP (Fabric A)	8	10-Gbps Ethernet LOM ports
4	Cisco UCS FI 6454 or 64108 (Fabric B)	9	10-Gbps Adapter card in PCIe slot 1
5	10GBase-T RJ-45 in Nexus 2232PP (Fabric B)	—	—

NOTE: In addition to supporting single wire management and dual wire management, FI 6454 and 64108 also support direct connection to C-Series.

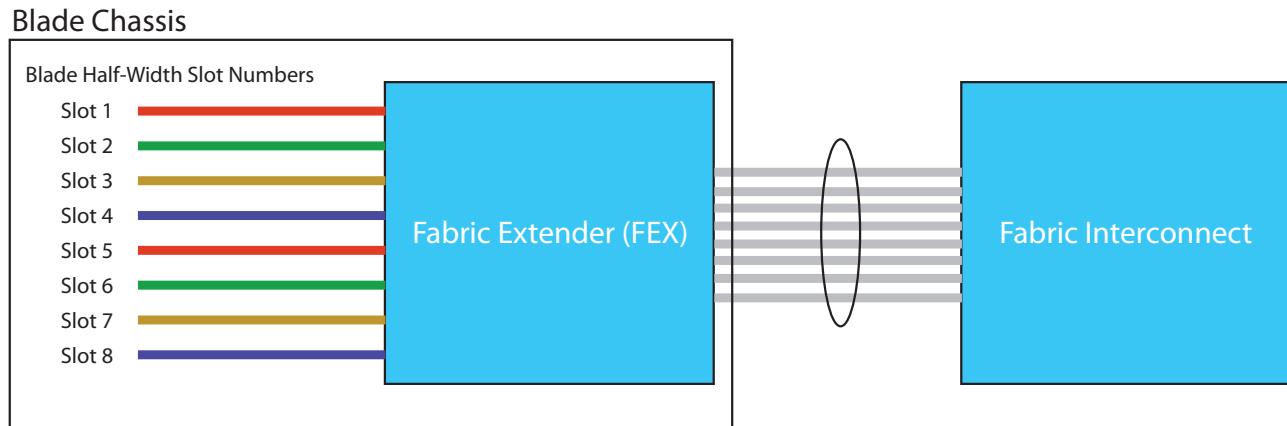

Blade Chassis Connection Types

In a blade chassis, the FEX fabric link (the link between the FEX and the FI) supports different types of connections:

- Port Channel Mode

In port channel mode, the FEX fabric links are bundled into a single logical link (see [Figure 20](#)) to provide higher bandwidth to the servers. Depending the FEX, up to 8 links can be port-channeled.
